

HEPATITIS C IN CANADA

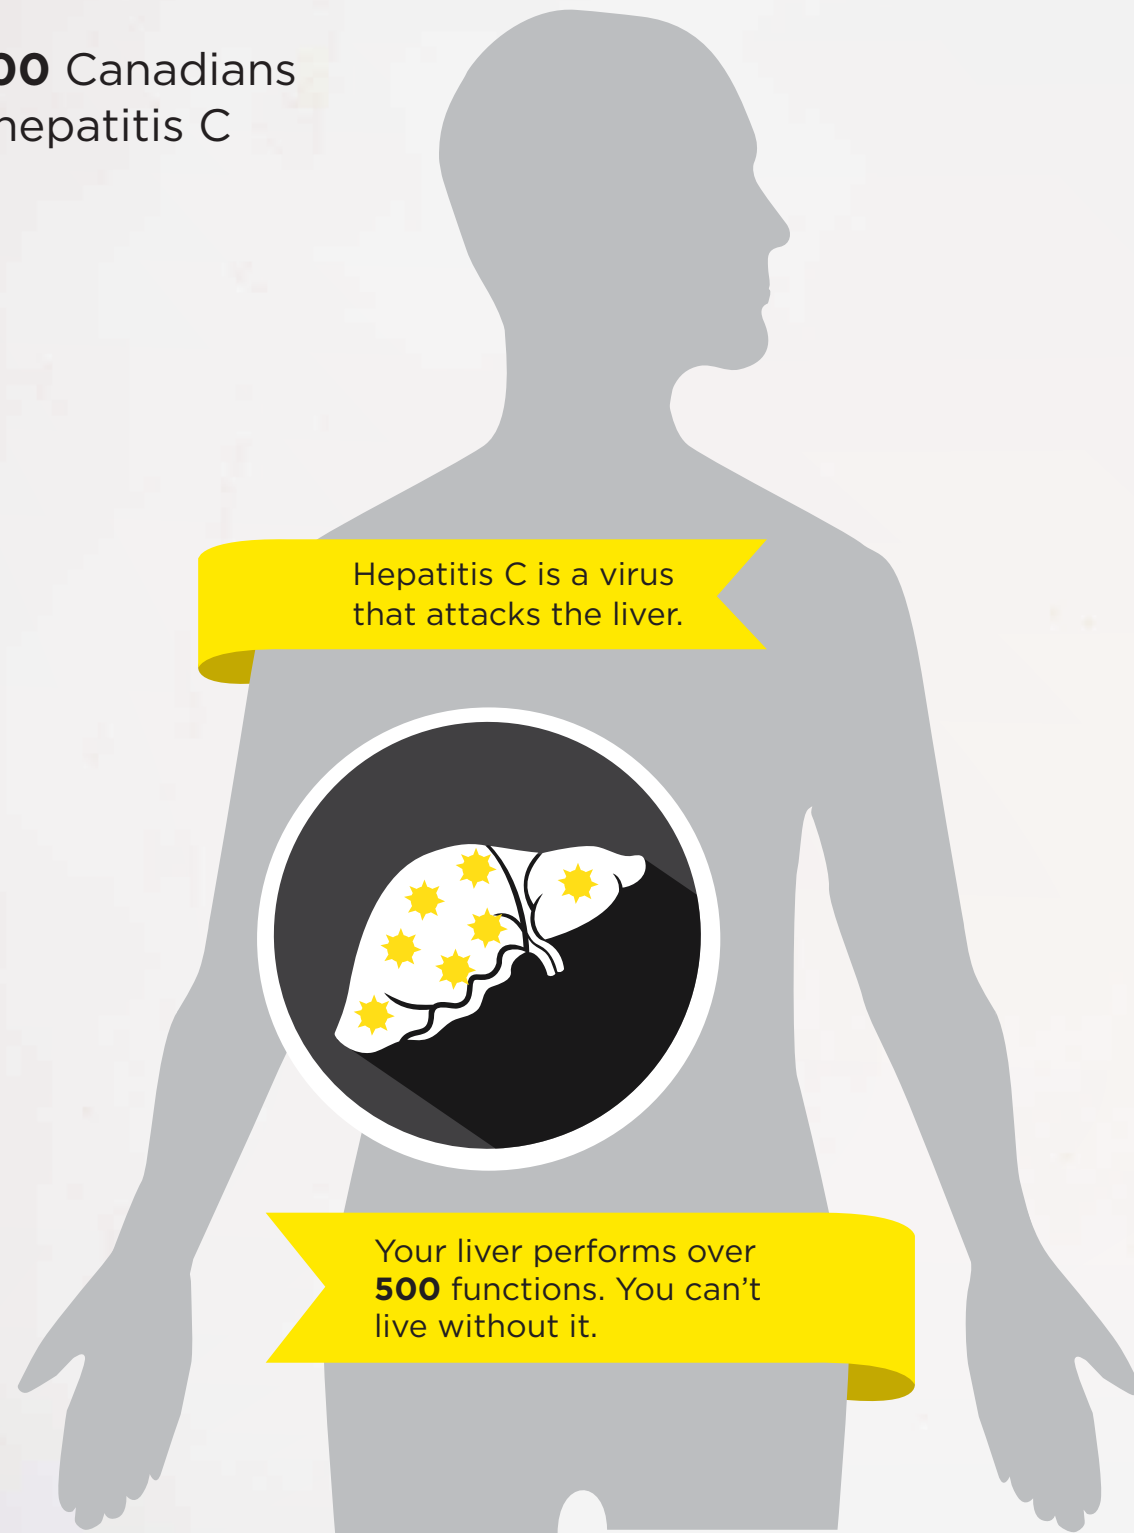

An estimated **1 out of 100** Canadians has been infected with hepatitis C in their lifetime.¹

35% were born outside of Canada¹, where most Hep C infections happen in healthcare settings.²

43% have injected drugs.¹ Lending or borrowing used equipment is a major risk factor for Hep C transmission.

A person can live **20 to 30** years with Hep C without any symptoms.³

An estimated **44%** of people with chronic Hep C in Canada don't know they have it.¹ The only way to know is to get tested.

Liver experts recommend that all Canadians born between **1945** and **1975** get tested for Hep C.³

There is **no** vaccine to protect against Hep C.

Treatment cures most people of hepatitis C. Treatments can be completed within eight to 12 weeks.
